

JAXFront license file deployment

If you deploy your own product where the JAXFront runtime JARS are embedded, be sure you place your JAXFront license into your deployment package to get rid of the JAXFront watersign.

There are two different possibilities:

- Add a directory called "lic" into your deployment root package and place your JAXFront license there. If your "user.dir" Java system variable points to a location where this directory (./lib) can be found at runtime, JAXFront will load the license from there first.
- Rename your JAXFront license file (e.q. JAXFront-Customer-XYZ-2006-01-01-4567.lic) to "jaxfront.lic" and place it anywhere in your runtime classpath. We suggest to put the renamed license file into the jaxfront-core.jar.
